

## Volotext

Fly out. Link in

Whether you are an international airline or the owner of a private airplane; whether you are a well-experienced pilot or a fresh co-pilot who fly passengers or cargo – volotext, our terminal weather information and text messaging application, is your eyes and ears while you fly.

In association with airline pilots, who have accumulated thousands of flight hours, as well as experienced engineers, we developed an iridium based cockpit application maintaining continuous online communication.

In-flight updates, including latest terminal weather information, appear on the pilot's laptop in the cockpit, thus enabling him to take the right decisions at the right time.

### What is Volotext?

This unique application offers the perfect solution – a two-way data communication environment on board. Because today, relying on traditional radios or even Satcom phones is just not enough. In-flight data communication is a must.

As a pilot, Volotext allows you to stay a click away from any essential information during your flight.

Volotext is a flexible, multi-functional application that, without the mediation of any manned operations office, enables you to:

- Request and receive weather reports and forecasts for any airport around the globe
- Send and receive text email
- Send maintenance reports to ground personnel
- Send SMS to mobile devices around the globe

### Key benefits

- An application created by pilots for pilots. It directly addresses the acute needs of cockpit crews worldwide. It reduces the dependence on ground personnel.
- Tried and tested system, already successfully operating on a commercial airline and several military transport planes.
- Available – it is ready to deploy and easy to use. All you need is a laptop, an Iridium phone and a communication cable.
- Reliable solution, based on the global Iridium communication network.
- Affordable product, offering an effective solution at a fair price.
- Here to stay – its users enjoy the distribution, support, customer care and financial backbone of an international communications solutions company.

**CHALLENGE • CREATE • CONNECT**

- Greatly increases the independence of private airplane pilots by granting them access to online communication services such as weather information or free text emailing.
- Continuously updated and upgraded

#### How does volotext work?

- Uses Iridium SMS/SBD (Short Burst Data).
- Uses Windows based laptop and USB/RS232 connections
- A central ground server
- Receives, transmits and distributes messages
- Guarantees quality of service
- Protects intellectual property and licensing
- Software enables flexible applications
